

The first part of the document discusses the general principles of the proposed system, which is designed to improve the efficiency of the existing process. It is based on the following assumptions:

1. The system should be able to handle a large volume of data.

2. The system should be able to process data in real-time.

3. The system should be able to handle data from multiple sources.

The second part of the document describes the architecture of the system, which is divided into three main components:

1. The input layer, which receives data from various sources.

2. The processing layer, which performs the necessary calculations and data manipulation.

3. The output layer, which displays the results of the processing.

The third part of the document discusses the implementation of the system, which involves the development of software and hardware components. It is expected that the system will be implemented over a period of six months.

The fourth part of the document discusses the testing and evaluation of the system, which will be carried out in a series of stages. It is expected that the system will be able to handle a large volume of data and process it in real-time.

The fifth part of the document discusses the future work, which includes the development of a more advanced system and the implementation of a user interface.
